                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The mRNA is the coding sequence of the combined cDNA inserts of recombinant vectors p gamma 298 and p gamma 11 (see AAN40024).

It encodes gamma anti-carcinoembryonic antigen chain. Using the vectors the immunoglobulin is produced readily in pure monoclonal form. Genetic manipulations can be used to produce chimeras of variants drawing their homology from species differing from each other. Protein manipulation is also possible.

Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

```
ligG-2b can be either secreted or membrane-bound. The difference between the two forms lies in the C-terminal peptides. The secreted tail is encoded immediately 3' to the C-gamma-2b-3 domain. The membrane-bound tail is encoded about 1.3 kb 3' to the same domain and is expressed via alternative mRNA splicing.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      EPSGPISTINPCPPCKECHKCPAPNLEGGPSVFIFPPNIKDVLMISLIPKVTCVVVDV
